Catching Up or Leading the Way
American Education in the Age of Globalization

Yong Zhao

ASCD in September
NGA/CCSSO Common Core Standards Initiative

Why is this initiative important?
Currently, every state has its own set of academic standards, meaning public education students in each state are learning to different levels. All students must be prepared to compete with not only their American peers in the next state, but with students from around the world. If all 49 states and territories adopt the common core state standards, this initiative will affect 43.5 million students which is about 87 percent of the student population (Source: SchoolDataDirect.org; 2007).

Why is a common core of state standards good for students?
These standards will help prepare students with the knowledge and skills they need to succeed in college and careers and to be prepared to compete globally. Additionally, expectations for students will be consistent across all states and territories; this consistency will support students transitioning between states. Also, clearer standards will help students better understand what is expected of them and allow for more self-directed learning.

http://www.corestandards.org/Files/CCSSIOne-Page.pdf
When I was growing up, my parents told me, “Finish your dinner. People in China and India are starving.” I tell my daughters, “Finish your homework. People in India and China are starving for your job.”

---Thomas Friedman, 2005
21st Century Challenge(s)
Globalization
1492: about 3 months

2009: about 13 hours
1858: 17 hours

Glory to God in the highest; on earth, peace and good will toward men.

2009: less than 1 minute
1927: $65 (about $1,000)

3 minute phone call

2009: about $0.02
By almost any economically relevant metric, distances have shrunk considerably in recent decades. The shrinking globe has been a major source of the powerful wave of worldwide economic integration and increased economic interdependence that we are currently experiencing. But the full implications of these developments for all aspects of our lives will not be known for many years. --Ben S. Bernanke, chairman of the U. S. Federal Reserve 2006

Death of Distance
Today, Indian engineers make $7,500 a year against $45,000 for an American engineer with the same qualifications. If we succeed in matching the very high levels of mastery of mathematics and science of these Indian engineers — an enormous challenge for this country — why would the world’s employers pay us more than they have to pay the Indians to do their work? They would be willing to do that only if we could offer something that the Chinese and Indians, and others, cannot.

*Two Million Minutes*, vividly reveals that American students are no longer “at risk” of falling behind -- they are now clearly behind even Third World students in India and China, in addition to being in 24th place among developed countries.

By comparing how these students prioritize their time (approximately four years or “two million minutes” of high school), the film demonstrates that the typical student in the U.S. spends much less time on his/her education and gives less thought to future career opportunities than his/her global peers in India and China. --2 million minutes

Catching up:
The Mismeasure of Education
Achievement Gap
Inside photos showed Alexei doing complicated experiments in physics and chemistry and reading aloud from *Sister Carrie*.

Stephen, by contrast, retreated from a geometry problem on the blackboard and the caption advised, "Stephen amused class with wisecracks about his ineptitude." Seated at a typewriter in typing class, Stephen tells us "I type about one word a minute."

1958

USSR

[Image of Life magazine cover with photos of Alexei Kutkov and Stephen Laperas, featuring a story about education in the USSR and the United States.]
Our Nation is at risk. Our once unchallenged preeminence in commerce, industry, science, and technological innovation is being overtaken by competitors throughout the world. The educational foundations of our society are presently being eroded by a rising tide of mediocrity that threatens our very future as a Nation and a people. We are raising a new generation of Americans that is scientifically and technologically illiterate.

The insert shows the data without the data from Japan, the United States, and the Euro5 and Asia5 groups. SOURCE: USPTO.
And
In December 2002, the Chinese Ministry of Education issued a policy designed to reform assessment and evaluation in elementary and secondary schools. This document, entitled *Ministry of Education’s Notice Regarding Furthering the Reform of Evaluation and Assessment Systems in Elementary and Secondary Schools*, calls for alternative assessments that go beyond simply testing academic knowledge. It specifically forbids ranking school districts, schools, or individual students based on test results or making test results public.

**High school curriculum reform**

Among the problems targeted by the reforms:

- Overemphasis on knowledge transmission
- Too many required and uniform courses, which limited students’ individual development
- Too much overlapping content, resulting in excessive coursework burden on students
- Overemphasis on the value of individual discipline, resulting in too little interdisciplinary and social integration

Remedies:

- Credit system
- More electives, fewer required courses
- Local subjects/school based curriculum
- Integrated studies
- New subjects (art, environment, technology, etc.)
Since 2001, Japan has been working to implement its Education Plan for the 21st Century, which has three major objectives:

- The first is “enhancing emotional education,” that is, cultivating students as emotionally well-rounded human beings.
- The second objective is “realizing a school system that helps children develop their individuality and gives them diverse choices” by moving towards a diverse, flexible educational system that encourages individuality and cultivates creativity.
- The third is “promoting a system in which the school’s autonomy is respected” through decentralizing educational administration, enhancing local autonomy, and enabling independent self-management at the school level. (Iwao, 2000)
Since 1997, Singapore another frequent high flyer in international comparative studies, has engaged in a major curriculum reform initiative. Entitled Thinking Schools, Learning Nation, this initiative aims to develop all students into active learners with critical thinking skills and to develop a creative and critical thinking culture within schools. Its key strategies include:

- The explicit teaching of critical and creative thinking skills;
- The reduction of subject content;
- The revision of assessment modes; and;
- A greater emphasis on processes instead of on outcomes when appraising schools.

In 2005, the Ministry of Education in Singapore released another major policy document Nurturing Every Child: Flexibility and Diversity in Singapore Schools, which called for a more varied curriculum, a focus on learning rather than teaching, and more autonomy for schools and teachers (Ministry of Education, 2005).
[Korea 2000]
Revised 7th National Curriculum

The ultimate goal is to cultivate creative, autonomous, and self-driven human resources who will lead the era's developments in information, knowledge and globalisation.

• Promote fundamental and basic education that fosters sound human beings and nurtures creativity
• Help students build self-leading capacity so that they well meet the challenges of today's globalisation and information development
• Implement learner-oriented education that suits the students' capability, aptitude and career development needs
• Ensure expanded autonomy for the local community and schools in curriculum planning and operation.
Why?
Achievement Gaps
The First International Mathematics Study (FIMS)

- Year data collected: 1964
- Target Population: 13 year olds
- Participating Countries: Australia, Belgium, England, Finland, France, Germany (FRG), Israel, Japan, Netherlands, Scotland, Sweden, United States.
- US finished second to last (Sweden)
Jefferson told us where to look to see if a nation is a success. He did not say to look at test scores. Instead, he said to look at “life, liberty, and the pursuit of happiness.”

--Keith Baker (2007)
40 years later: Wealth

FIMS scores in 1964 correlate at $r = -0.48$ with 2002 PPP-GDP. In short, the higher a nation’s test score 40 years ago, the worse its economic performance on this measure of national wealth.
40 years later: Rate of Growth

The nations that scored better than the U.S. in 1964 had an average economic growth rate for the decade 1992-2002 of 2.5%; the growth rate for the U.S. during that decade was 3.3%. The average economic growth rate for the decade 1992-2002 correlates with FIMS at $r = -0.24$.

Like the generation of wealth, the rate of economic growth for nations improved as test scores dropped.
40 years later: Productivity

There is no relationship between FIMS scores and hourly output, $r = -.03$. In 2004, the average hourly output of those nations that outscored the U.S. in 1964 was 3.4% lower than U.S. productivity, though the three nations with higher hourly output all had higher test scores than the U.S.
40 years later: Quality of Life

The average rank on the Quality of Life Index for nations that scored above the U.S. on FIMS was 10.8. The U.S. ranked seventh (lower numbers are better). FIMS scores correlated with Quality of Life at $r = -0.57$. 
40 years later: Democracy

On the Economy Intelligence Unit’s Index of Democracy, those nations that scored below the median on FIMS have a higher average rank on achieving democracy (9.8) than do the nations that scored above the median (18). Once again, the U.S. scored higher on attaining democracy than did nations with higher 1964 test scores.
40 years later: Livability

An alternative to the Quality of Life Index, the Most Livable Countries Index, shows that six of the nine countries that scored higher on FIMS than the U.S. are worse places to live. Livability correlates with FIMS scores at $r = -0.49$. 
40 years later: Creativity

The number of patents issued in 2004 is one indicator of how creative the generation of students tested in 1964 turned out to be. The average number of patents per million people for the nations with FIMS scores higher than the U.S. is 127. America clobbered the world on creativity, with 326 patents per million people. However, FIMS scores do correlate with the number of patents issued: $r = .13$ with the U.S. and $r = .49$ without the U.S.
