

Thomas Mroz, Ph.D., Professor of Economics, is a labor economist whose research also encompasses economic demography, health economics, program evaluation, transition economics, and applied econometrics. He received his Ph.D. from Stanford University in 1984. He was a professor in the Department of Economics at the University of Chicago and in the Department of Economics at the University of North Carolina, Chapel Hill before joining Clemson University in 2007. His research focuses on the estimation of behavioral responses of individuals to changes in their social and economic environments. Recently he has studied the economic determinants of diets in China and Russia and explored the importance of family planning programs for reducing fertility in Tanzania, Peru, and Indonesian. He currently is working on an assessment of the importance of female education for lowering child mortality in Indonesia, evaluations of the impacts of Mexico's Oportunidades program on contraceptive use and the presence of skilled attendants at births, a set of papers examining the impacts of parent's compensatory behaviors on child outcomes in the Philippines, and a study of how parents make decisions about where to live and how much to work and the impacts of these decisions on their children's intellectual development. He serves on the external review committee assembled by the Mexico's Minister of Health for the evaluation of Mexico's new social health insurance program (Seguro Popular). His econometric work on factor models has been applied to control for endogenous health and behavioral determinants in a wide variety of non-experimental program evaluations. A major focus of his work assesses the reliability of empirical research tools to yield unbiased and accurate estimators of behavioral relationships for explaining labor market, health, and demographic outcomes
